

# HELIODOR + SLURRYKIT

 **LEMKEN** THE AGROVISION COMPANY

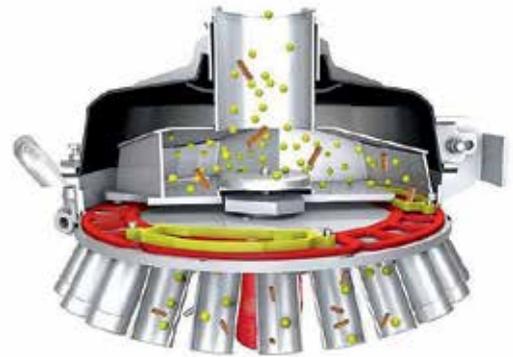

# THE DREAM TEAM FOR SPREADING SLURRY

Spreading slurry comes with considerable challenges, especially in view of high fertiliser prices. The **Heliodor** compact disc harrow by LEMKEN, combined with the **SlurryKit** (DosiMat DMX precision spreader by Vogelsang), sets new benchmarks. With these two powerhouses behind the slurry tank, you can count on efficient work processes, optimal nutrient utilisation and high efficacy.

## RELIABLY SMOOTH RUNNING

The slurry is fed into the DosiMat distributor head from above, homogenised in a flow-optimised rotor equipped with cutting blades and pushed into the individual outlets. Fibre and foreign matter are reliably shredded in the process – this enables the desired precision spreading and supports blockage-free operation of the LEMKEN **Heliodor**.

The DosiMat distributor head ensures that slurry is distributed homogeneously.

## VIRTUALLY LOSS-FREE

The inclined, horizontally arranged rows of discs in the **Heliodor** open the soil at a depth of 5 to 12 cm. Right behind these discs, the precision spreader places a band of slurry which is covered immediately with soil by the second row of discs. A trailing roller ensures optimal reconsolidation. The combination of these two work steps in a single pass makes it very easy to comply with the four-hour rule for incorporating slurry.

in action here!

# YOUR BENEFITS AT A GLANCE:

- 2-in-1: initial tillage + slurry application
- Saves time and money
- Ensures optimal nutrient utilisation
- High efficacy and broad incorporation
- Compact design and low power requirements

OUR DRIVING FORCE: **YOUR SUCCESS!**
