

The catch crop and granulate spreader **MultiHub**

TO THE POINT

- Easy operation via an ISOBUS terminal
- Convenient calibration
- In combination with seed drill technology: width section control to avoid overlaps

SPECIFICATIONS

Designation	MultiHub 200	MultiHub 500
Hopper volume [l]	200	500
Hopper weight [kg]	60	80
Max. application rate [kg/ha]	170	170
Fan drive	Hydraulic	Hydraulic
Implement-lift signal	Mechanical	Hydraulic
Combination options	Heliodor 9 / Rubin 10 MR / Karat 10 (U) / Solitaire M	Heliodor 9 KA / Rubin 10 TF / Karat K(U)A / Solitaire DT

Catch crops are becoming increasingly popular for improving soil health, nutrient retention and biodiversity. LEMKEN offers the MultiHub for this purpose, which is **versatile and economical** to use by reducing passes and combining applications. This mounted implement is suitable for both sowing catch crops during stubble tillage and spreading fine seeds or granulates directly with the main seeds from a seed drill.

What makes the MultiHub special: It can be equipped with **width section or half-side control** to avoid overlaps and save seed. Width section control can be operated directly from the tractor cab via the ISOBUS terminal and machine software. When used with a seed drill, the MultiHub has the same number of width sections as the seed drill. The view is fully integrated into the seed drill user interface as an additional seeding line. When the MultiHub is used with a trailed tillage implement, one half can be deactivated.

Perfect distribution

Depending on the working width and combination implement, up to four width sections can be switched automatically. Width sections are controlled via a metering motor and a diverter valve. This **prevents overlaps and reduces seed costs.**

To ensure **precise transverse distribution in the soil flow** across the full working width, even in adverse weather conditions, a hydraulically driven fan transports the seed to the distributor heads of the individual width sections and then to the splash plates.

Always the right rate

Depending on the hopper volume, either one or two metering units are installed, which are equipped with up to two seed lines. When the MultiHub is combined with a seed drill, metering is started via the machine control. Various metering shafts ensure that the **right amount of seed is delivered at all times.**
